

Version Tracking

Format: MAJOR.MINOR.PATCH

0.1.0

Practical example for Zenet:

v0.1.0 - Initial MVP (Bienvenida, Clasificación, Configuración)

v0.2.0 - Add Alineamiento section

v0.3.0 - Add Estructura section

v0.4.0 - Add Manual_operativo section

v0.4.1 - Fix alignment agent bug

v0.4.2 - Performance optimization

v1.0.0 - Feature complete, stable API

v1.1.0 - New feature (multi-location support)

v2.0.0 - Major rewrite (different data model)

How to track it:

- Update **VERSION** in your code (e.g., `__version__ = "0.1.0"` in `core/__init__.py`)
- Tag releases in git: `git tag v0.1.0`

- Update `pyproject.toml` version field
- Keep a `CHANGELOG.md` documenting what changed

For right now: Don't overthink it. Just bump 0.1 → 0.2 when you finish Alineamiento task, and you're good.
