

V 0.1 Production System

Area	Importancia	Notas
Sprint Planning / Agile management	High	Software project management and project documentation (Notion, task master ai)
Backend	High	API design, business logic, data
Front End	High	Next.js, responsive design, state management
Database	High	Schema design, migrations, indexing
Version Tracking	High	Software version tracking
Test	High	Unit, integration, E2E (Playwright)
AI & Prompt Engineering	High	AI workflows, Agent prompts, response models, retries
UI / UX	High	Design system, restaurant operator feedback

CI / CD	High	GitHub Actions, automated testing, deployments
Security	High	Auth, data encryption, PII handling
Monitoring	Medium	Logs, errors, performance, costs
API Design	High	RESTful endpoints, documentation (OpenAPI)
Performance	Medium	Caching, query optimization, load times
Multi Tenancy	High	Restaurants isolated, secure data separation
Error Hadling	High	User-friendly errors, fallbacks
Documentation	Medium	Code docs, API docs, runbooks
Deployment	High	Infrastructure (Vercel, AWS), scaling

"Zenet evolves from a validated MVP concept (Gradio MVP) into a commercial SaaS platform (production) that enables restaurants to standardize operations through AI-guided workflows, with rolling releases every 3-4 weeks, targeting 5-10 paying customers by December 2026."

MVP (Gradio) vs Production (Zenet)

Gradio MVP: Concept Validation

What we built:

A local, single-restaurant proof-of-concept that validates the core product idea:

- 6-section pipeline guiding restaurant operators through operational standardization
- AI agents (Claude-powered) that propose inventory structures, recipes, categories
- Local SQLite database storing test data
- Jupyter-like interface (Gradio) for development speed
- No cloud infrastructure (runs on your laptop)
- No authentication (session-based, local only)
- No payment (free testing)

Purpose:

- Answer: "Does this product solve real restaurant problems?"
- Test with 1-2 pilot restaurants
- Gather feedback on UX/flow
- Validate Claude agent quality
- Prove the concept works

Timeline:

- Built: January - April 2026
 - Status: Complete (all 6 sections done)
 - Users: Internal testing + pilot restaurants
-

Production (Zenet): Commercial SaaS

What we're building:

A cloud-based multi-tenant SaaS platform that commercializes the MVP:

- Web application (Next.js) running in browser, globally accessible
- Professional backend (FastAPI) handling business logic + agent orchestration

- PostgreSQL database (Supabase) with row-level security for multi-tenancy
- Real authentication (Supabase Auth) with user accounts + teams
- Monitoring & observability (Sentry, Langfuse, UptimeRobot)
- CI/CD pipeline (GitHub Actions) for automated testing/deployment
- Scalable infrastructure (Vercel + Railway) ready for 1000s of restaurants
- Payment integration (Stripe) for SaaS billing
- Professional support (email, in-app help, knowledge base)

Purpose:

- Launch a commercial product restaurants pay for
- Acquire 5-10 paying customers by December 2026
- Prove product-market fit with revenue
- Build a sustainable business
- Scale to 100+ restaurants by 2027

The Transition

Gradio MVP (Jan-April 2026)

|

└─ Learnings: "This solves a real problem"

└─ Feedback: "Restaurant operators want this"

└─ Validation: "AI agents work"

↓

Parallel Development (May-June)

|

└─ Finish MVP (Task 11, 12)

└─ Start Production Build

└─ Find pilot restaurants

└─ Plan commercial launch

↓

Production Launch (June 1)

|

└─ Release Bienvenida + Clasificación

- └— 5 pilot restaurants sign up
- └— Rolling releases every 3 weeks
- └— Validate willingness to pay

Commercial Traction (Oct-Dec)

- |
- └— 5-10 restaurants paying
- └— Measure: revenue, churn, NPS
- └— Iterate based on feedback
- └— Plan v1.1 features

Scaling (2027+)

- |
- └— Expand to 100+ restaurants
- └— Build customer success team
- └— Add advanced features
- └— Explore partnerships

Key Differences

MVP (Gradio) Architecture

Your Laptop

- └— Python code (core/)
- └— Gradio UI (jupyter-like)
- └— SQLite database (local file)
- └— Claude API (cloud)

Access: <http://localhost:7860> Users: 1 (you) + 2-3 pilot testers

Data: Ephemeral (test data only)

Production (Zenet) Architecture

Cloud Infrastructure

- └— Next.js Frontend (Vercel CDN, global)
- └— FastAPI Backend (Railway, us-east-1)
- └— Supabase PostgreSQL (multi-tenant with RLS)
- └— Supabase Auth (JWT, user management)

└── Monitoring (Sentry, Langfuse, UptimeRobot)
└── CI/CD (GitHub Actions auto-deploy)

Access: <https://zenetapp.com> Users: 1-100+ paying restaurants

Data: Persistent, backed up, recoverable

Security: RLS, encryption, audit logging

What Stays the Same

✓ Core product concept:

- AI agents proposing solutions (Claude-powered)
- Restaurant operator as the user
- Goal: Standardize restaurant operations

✓ Core value proposition:

- Reduces operational chaos
- Improves inventory accuracy
- Enables data-driven decisions
- Saves time on manual setup

✓ Tech foundation:

- Claude API for agent intelligence
 - Python backend
 - React-based frontend
 - Relational database
-

What Changes

MVP

- Monolithic Gradio app
- Local SQLite
- No users/auth

- No payments
- Test data only
- Manual SQL migrations
- No monitoring
- Single instance

Production

- Decoupled: Frontend + Backend + Database
 - Multi-region PostgreSQL
 - Professional auth + teams
 - Stripe payment integration
 - Real restaurant data (with backups)
 - Alembic migrations
 - Production monitoring
 - Auto-scaling infrastructure
-

Business Model Shift

MVP

Free testing tool

No revenue

Goal: Validate concept

Success metric: Does it work?

Production

Freemium SaaS

\$99-299/month per restaurant

Goal: Build sustainable business

Success metrics:

- 5-10 paying customers (by Dec 2026)
- < 10% monthly churn

- 4.0 NPS score
 - < 2s agent response time
 - 99%+ uptime
-

Development Approach Shift

MVP

- Focus on speed (validate quickly)
- Single developer (you)
- Minimal infrastructure
- Test with 2-3 restaurants
- Iterate based on feedback
- No deployment pipeline needed

Production

- Focus on quality (production-ready)
 - Team-friendly (clear docs, tests, CI/CD)
 - Professional infrastructure (Vercel, Railway, Supabase)
 - Scale to 5-10 restaurants quickly
 - Iterate based on user data + revenue
 - Robust deployment pipeline (automated tests/deloys)
-

Success Metrics Shift

MVP Success

- ✓ All sections work
- ✓ No crashes with test data
- ✓ Agent gives reasonable proposals
- ✓ 2-3 restaurants willing to test
- ✓ Positive feedback on concept

Production Success

- ✓ 5-10 restaurants paying by Dec 2026
 - ✓ 99%+ uptime
 - ✓ < 2s agent response time (p95)
 - ✓ < 10% monthly churn
 - ✓ 4.0+ NPS score
 - ✓ Zero critical security issues
 - ✓ WCAG 2.1 AA accessibility
 - ✓ Positive product reviews
-
-

For Your PRD: Recommended Structure

Zenet Production PRD v1.0

1. Product Overview

[Use the one-line summary above + MVP context]

2. Problem Statement

[What problems does Zenet solve for restaurants?]

3. Solution Overview

[How Zenet solves those problems]

4. MVP Validation

[What was learned from Gradio MVP]

5. Product Vision (Production)

[What we're building in Zenet SaaS]

6. Target Users

[Restaurant operators, 10-100 seat restaurants]

7. Success Metrics

[5-10 paying customers by Dec 2026, etc.]

8. Feature Roadmap

[6 sprints, each releasing 1 section]

9. Go-to-Market

[Pilot group → wider launch → scale]

10. Business Model

[Freemium SaaS, \$99-299/month]
